```
**************************************************************;
*   Activity 5.03                                          *;
*      1) This code creates a macro variable named oc that *;
*         stores the text string Pacific. The oc macro     *;
*         variable is then used in the WHERE statement to  *;
*         subset the data.                                 *;
*      2) Update the TITLE2 statement to use the macro     *;
*         variable. Run the program.                       *;
*      3) Change the value of the macro variable to        *;
*         Atlantic and run the program again.              *;
**************************************************************;
